Profile

Backend-focused developer specializing in Java and Spring Boot, with secondary experience in C# and ASP.NET. Interested in software architecture, system design, cloud/devops technologies, and AI-driven backend solutions, including AI/LLM integrations. Experienced in building REST APIs, working with SQL databases, Docker, Redis, CI/CD pipelines, and Git-based workflows.

Tech Stack

- Main Backend: Java, Spring Boot, Maven, JPA/Hibernate
- Secondary Backend: C#, ASP.NET, Entity Framework Core
- Databases: PostgreSQL, MySQL, Microsoft SQL Server
- DevOps & Cloud: Docker, GitHub Actions, CI/CD Pipelines, Deployment
- Architecture: Layered Architecture, Onion Architecture, Modular Monolith
- Tools: Git, GitHub, Jira, Postman, Swagger/OpenAPI
- Other: Git Workflows, REST API Design, JWT Authentication, Redis

Projects & Contributions

[Multi-Vendor Event Management System](#) | Backend Developer — Security & Authentication Modules

- Developed authentication and authorization modules using Spring Security and JWT.
- Implemented Role-Based Access Control (RBAC) for admin, vendor, and user roles.
- Built secure login and registration flows with token-based authentication.
- Developed an SMS-based account verification flow for user onboarding.
- Configured stateless session management and protected API routes to improve backend security.
- Applied layered architecture by separating controller, service, repository, and configuration responsibilities.

[NUnit Framework](#) | Open Source Contributor

- Implemented a generic `Enum.Parse<T>()` polyfill using C# extension types to support backward compatibility for .NET Framework builds.
- Refactored internal framework usage in `RuntimeFramework` and `FrameworkController` to use the new generic API.
- Improved type safety, readability, and consistency across the codebase.
- Collaborated with maintainers to refine the API design and followed project coding standards.
- Contributed via PR #5102.

[SimpleAccounting](#) | Open Source Contributor

- Fixed critical bugs in account filtering logic within `ImportBookingsViewModel` and `ImportEntryViewModel` using the MVVM pattern.
- Added unit tests to cover active and inactive account filtering scenarios during imports.
- Improved data integrity by ensuring only valid accounts are available in import workflows.
- Refactored legacy XML deserialization logic to reduce null reference risks.
- Contributed via PR #363.

Education

Bachelor of Information Technologies at Azerbaijan Technical University — Sep 2023 - July 2027
